Learning Theory & Depression

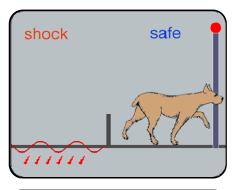

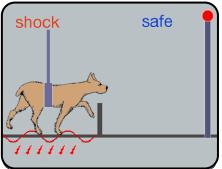

This activity will help you to:

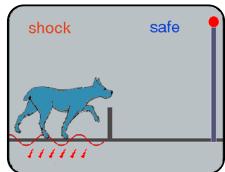

- Understand Seligman's (1974) Learned Helplessness theory of depression
- Comment on the implications of Seligman's research
- Critically assess Seligman's animal studies

Learned Helplessness

According to Seligman's learned helplessness theory, depression occurs when a person learns that their attempts to escape negative situations make no difference. As a consequence they become passive and will endure aversive stimuli or environments even when escape is possible. Seligman based his theory on research using dogs.

A dog put into a partitioned cage learns to escape when the floor is electrified.

If the dog is restrained whilst being shocked it eventually stops trying to escape.

Dogs that were previously restrained no longer try to escape, even when able to do so.

How might Seligman's research help us to understand depression in humans?

Outline a scientific objection to Seligman's research

Outline an ethical objection to Seligman's research
